

MAEG4060 Stage 2 Development Report

Names & IDs:

Guo Tsun Hei (1155186272): 3D Modeling, Texturing, Rigging, and Animation

Yim Fu Chong (1155176974): Programming, Physics Engine, and System Integration

1 Landscape Model

The landscape will be generated programmatically using a heightmap. The heightmap asset has been finalized.

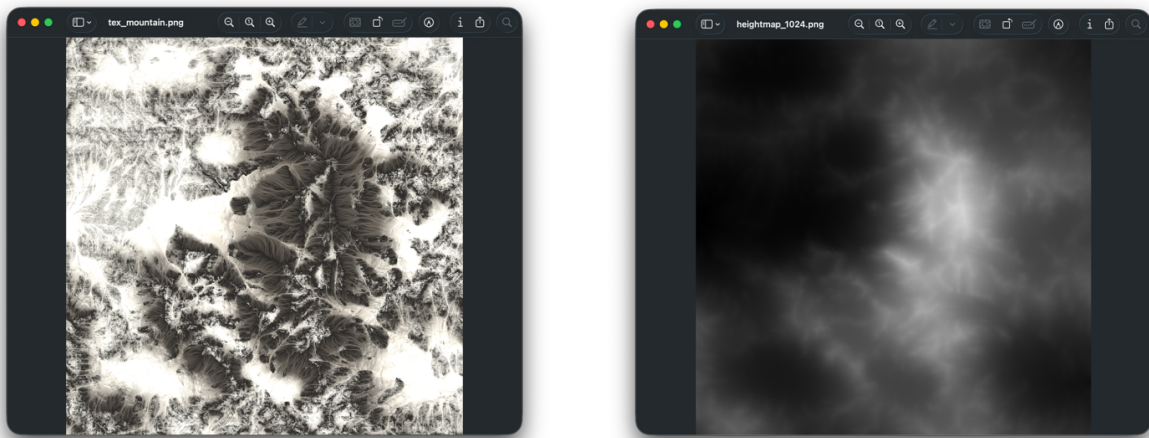

Figure 1: Terrain assets: heightmap and texture (from project documentation).

2 3D Models and Textures

All required static and controllable models have been acquired, textured, and successfully converted into the DirectX compatible .x format.

Files included in submission:

model_jeep.x, model_windmill.x, model_crate.x, model_boulder.x
(adjust to match your actual submission bundle.)

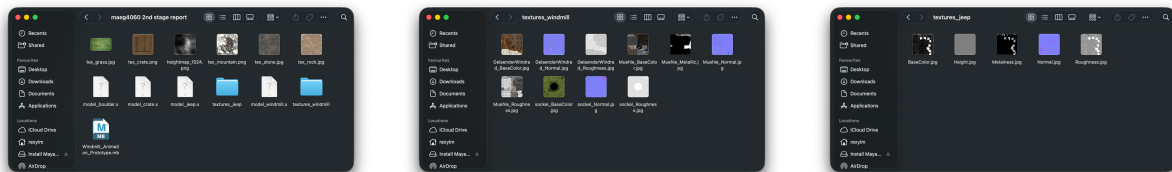

Figure 2: Textured models prepared for .x export and engine integration.

3 Model Animation (Maya)

To satisfy the animation requirement, the rotational animation for the Windmill was keyframed inside Autodesk Maya. The hierarchical structure allows the engine to parse the animation frames for playback.

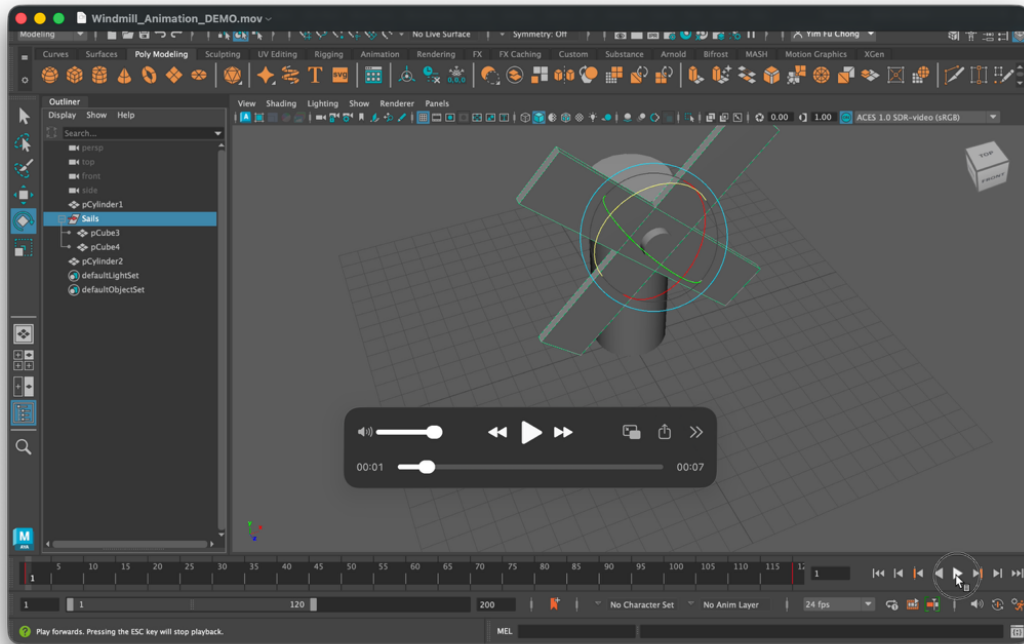

Figure 3: Autodesk Maya: windmill rig and keyframed rotation (timeline visible).
